Review of the criteria

2

Pixel perfect

3

Browser Compatibility

4

Content overflow

Quality criteria for coding

WHY?

- For developing websites according to the latest industry standards.
- For optimizing the website to ensure fast loading.
- For user-friendly website experience.

Course completion criteria

-
- To successfully complete the course, the project must meet **all mandatory requirements** ❤️
 - Basic criteria – 🧡 will allow you to defend the project with a **maximum grade**
 - Bonus criteria – 🟢 if you've done everything and want to try something extra
 - There will be **three iterations** (attempts) to submit the project.
-

Criteria

- ✓ HTML
- ✓ CSS
- ✓ Images
- ✓ Layout
- 👁️ For all site

Perfect Pixel

Matching the layout to the design pixel by pixel.

Blocks must be positioned exactly 1:1 as in the design. A text margin difference of **up to 5px** is allowed. Adjusting the sizes and positioning of poorly designed blocks is acceptable (differences of 1-2px across different pages are allowed).

Why is it important:

The client receives work that matches the approved design.

How to Achieve Pixel Perfect

1. Download the **Perfect pixel** plugin for Chrome.
2. Upload the design **screenshot**.
3. Set the **screen width to match the screenshot**.
4. Set **coordinates to 0 0**.
5. Make the screenshot **semi-transparent**.
6. Click the **lock icon** to **fix the screen**, so it doesn't move when scrolling.
7. Open **DevTools** and **adjust** the necessary margins/padding/sizes.
8. **Transfer** these values to VS Code.

Do not change the screenshot's scale.

You can use the inversion mode if it helps.

Browser Compatibility

♥ The layout should display identically in the latest versions of Chrome, Opera, Firefox, Safari, and Edge.

Device relative bugs

Browser relative bugs

Browser Compatibility

The last two versions of browsers:
Chrome, Opera, Firefox, Safari, Edge

All browsers have different rendering methods, and some elements may look different.

A difference of 2-3 pixels between browsers is normal.

The main thing is that the grid should remain consistent.

How to Achieve Cross-Browser Consistency

- Install all available browsers on your computer, smartphone, and tablet.
- Use testing services for specific devices (some are partially free).

[BrowserStack](#)

[LambdaTest](#)

[CrossBrowserTesting](#)

Horizontal Page Scrolling

- **Add outline to all blocks (*)** and see which one goes beyond the screen boundaries.
- **Remove blocks** one by one and check after which block's removal the scroll disappears.
- **Remove 100vw** (on Windows, scrollbar width is added to this width).

```
* { outline: 1px solid red; }
```

♥ The site should handle content overflow gracefully.

Content Overflow

After development, **anything can change**: text/images might be added, removed, or updated.

Websites are often connected to a CMS.

Content Overflow

It is time to
paaarty

How to check:

- **Replace images** with ones larger/smaller than the original.
- Add **more/less text** wherever it's present.
- Insert **long words**.
- Add new items in lists

The layout should not break, and text should not overflow beyond the block's boundaries.

Confirm deletion

Do you really want to delete the external data folder? Btw, sorry for the ugly layout of this dialog.

No

Yes

- ! all content must be visible
- ! content must not broke layout

Add paddings inside
text blocks

Oops

Fixing Content Overflow

- **Avoid using fixed width and height,** only use minimum values if needed.
 - ✓ min-height
 - ✓ min-width
 - ✗ max-height
- Set a maximum block width of 100%.
- Avoid using negative margins.

Fixing Content Overflow

- Use **overflow** to hide text that doesn't fit or to create scrollbars within a block.
- For long words in small fields, use properties like **word-break** or **overflow-wrap**
- Use **flexbox** to allow wrapping
